**python-gitlab** is a Python package providing access to the GitLab server API.

It supports the v4 API of GitLab, and provides a CLI tool (`gitlab`).

## **INSTALLATION**

As of 3.0.0, `python-gitlab` is compatible with Python 3.7+.

Use pip to install the latest stable version of `python-gitlab`:

```
$ pip install --upgrade python-gitlab
```

The current development version is available on both [GitHub.com](#) and [GitLab.com](#), and can be installed directly from the git repository:

```
$ pip install git+https://github.com/python-gitlab/python-gitlab.git
```

From GitLab:

```
$ pip install git+https://gitlab.com/python-gitlab/python-gitlab.git
```

## USING THE DOCKER IMAGE

You can run the Docker image directly from the GitLab registry:

```
$ docker run -it --rm registry.gitlab.com/python-gitlab/python-gitlab:latest <command> ...  
→ .
```

For example, to get a project on GitLab.com (without authentication):

```
$ docker run -it --rm registry.gitlab.com/python-gitlab/python-gitlab:latest project get →  
→ --id gitlab-org/gitlab
```

You can also mount your own config file:

```
$ docker run -it --rm -v /path/to/python-gitlab.cfg:/etc/python-gitlab.cfg registry.  
→ gitlab.com/python-gitlab/python-gitlab:latest <command> ...
```

### 2.1 Building the image

To build your own image from this repository, run:

```
$ docker build -t python-gitlab:latest .
```

Run your own image:

```
$ docker run -it --rm -v python-gitlab:latest <command> ...
```

## **GITTER COMMUNITY CHAT**

We have a [gitter](#) community chat available at <https://gitter.im/python-gitlab/Lobby>, which you can also directly access via the Open Chat button below.

If you have a simple question, the community might be able to help already, without you opening an issue. If you regularly use python-gitlab, we also encourage you to join and participate. You might discover new ideas and use cases yourself!

## **DOCUMENTATION**

The full documentation for CLI and API is available on [readthedocs](#).

### **5.1 Build the docs**

We use `tox` to manage our environment and build the documentation:

```
pip install tox  
tox -e docs
```

## **CONTRIBUTING**

For guidelines for contributing to `python-gitlab`, refer to [CONTRIBUTING.rst](#).

### **6.1 Getting started with the CLI**

`python-gitlab` provides a `gitlab` command-line tool to interact with GitLab servers.

This is especially convenient for running quick ad-hoc commands locally, easily interacting with the API inside GitLab CI, or with more advanced shell scripting when integrating with other tooling.

#### **6.1.1 Configuration**

`gitlab` allows setting configuration options via command-line arguments, environment variables, and configuration files.

For a complete list of global CLI options and their environment variable equivalents, see [\*CLI reference \(gitlab command\)\*](#).

With no configuration provided, `gitlab` will default to unauthenticated requests against [GitLab.com](#).

With no configuration but running inside a GitLab CI job, it will default to authenticated requests using the current job token against the current instance (via `CI_SERVER_URL` and `CI_JOB_TOKEN` environment variables).

**Warning:** Please note the job token has very limited permissions and can only be used with certain endpoints. You may need to provide a personal access token instead.

When you provide configuration, values are evaluated with the following precedence:

1. Explicitly provided CLI arguments,
2. Environment variables,
3. Configuration files:
  - a. explicitly defined config files:
    - i. via the `--config-file` CLI argument,
    - ii. via the `PYTHON_GITLAB_CFG` environment variable,
  - b. user-specific config file,
  - c. system-level config file,
4. Environment variables always present in CI (`CI_SERVER_URL`, `CI_JOB_TOKEN`).

Additionally, authentication will take the following precedence when multiple options or environment variables are present:

1. Private token,
2. OAuth token,
3. CI job token.

## Configuration files

`gitlab` looks up 3 configuration files by default:

**The `PYTHON_GITLAB_CFG` environment variable** An environment variable that contains the path to a configuration file.

**/etc/python-gitlab.cfg** System-wide configuration file

**~/.python-gitlab.cfg** User configuration file

You can use a different configuration file with the `--config-file` option.

**Warning:** If the `PYTHON_GITLAB_CFG` environment variable is defined and the target file exists, it will be the only configuration file parsed by `gitlab`.

If the environment variable is defined and the target file cannot be accessed, `gitlab` will fail explicitly.

## Configuration file format

The configuration file uses the INI format. It contains at least a `[global]` section, and a specific section for each GitLab server. For example:

```
[global]
default = somewhere
ssl_verify = true
timeout = 5

[somewhere]
url = https://some.whe.re
private_token = vTbFeqJYCY3sibBP7BZM
api_version = 4

[elsewhere]
url = http://else.whe.re:8080
private_token = helper: path/to/helper.sh
timeout = 1
```

The `default` option of the `[global]` section defines the GitLab server to use if no server is explicitly specified with the `--gitlab` CLI option.

The `[global]` section also defines the values for the default connection parameters. You can override the values in each GitLab server section.

Table 1: Global options

Option	Possible values	Description
ssl_verify	True, False, or a str	Verify the SSL certificate. Set to <code>False</code> to disable verification, though this will create warnings. Any other value is interpreted as path to a CA_BUNDLE file or directory with certificates of trusted CAs.
timeout	Integer	Number of seconds to wait for an answer before failing.
api_version	4	The API version to use to make queries. Only 4 is available since 1.5.0.
per_page	Integer between 1 and 100	The number of items to return in listing queries. GitLab limits the value at 100.
user_agent	str	A string defining a custom user agent to use when gitlab makes requests.

You must define the `url` in each GitLab server section.

**Warning:** Note that a url that results in 301/302 redirects will raise an error, so it is highly recommended to use the final destination in the `url` field. For example, if the GitLab server you are using redirects requests from http to https, make sure to use the `https://` protocol in the URL definition.

A URL that redirects using 301/302 (rather than 307/308) will most likely cause malformed POST and PUT requests. python-gitlab will therefore raise a `RedirectionError` when it encounters a redirect which it believes will cause such an error, to avoid confusion between successful GET and failing POST/PUT requests on the same instance.

Only one of `private_token`, `oauth_token` or `job_token` should be defined. If neither are defined an anonymous request will be sent to the Gitlab server, with very limited permissions.

We recommend that you use [Credential helpers](#) to securely store your tokens.

Table 2: GitLab server options

Option	Description
<code>url</code>	URL for the GitLab server. Do <b>NOT</b> use a URL which redirects.
<code>private_token</code>	Your user token. Login/password is not supported. Refer to <a href="#">the official documentation</a> to learn how to obtain a token.
<code>oauth_token</code>	An Oauth token for authentication. The Gitlab server must be configured to support this authentication method.
<code>job_token</code>	Your job token. See <a href="#">the official documentation</a> to learn how to obtain a token.
<code>api_version</code>	GitLab API version to use. Only 4 is available since 1.5.0.
<code>http_username</code>	Username for optional HTTP authentication
<code>http_password</code>	Password for optional HTTP authentication

## Credential helpers

For all configuration options that contain secrets (`http_password`, `personal_token`, `oauth_token`, `job_token`), you can specify a helper program to retrieve the secret indicated by a `helper:` prefix. This allows you to fetch values from a local keyring store or cloud-hosted vaults such as Bitwarden. Environment variables are expanded if they exist and `~` expands to your home directory.

It is expected that the helper program prints the secret to standard output. To use shell features such as piping to retrieve the value, you will need to use a wrapper script; see below.

Example for a `keyring` helper:

```
[global]
default = somewhere
ssl_verify = true
timeout = 5

[somewhere]
url = http://somewhe.re
private_token = helper: keyring get Service Username
timeout = 1
```

Example for a `pass` helper with a wrapper script:

```
[global]
default = somewhere
ssl_verify = true
timeout = 5

[somewhere]
url = http://somewhe.re
private_token = helper: /path/to/helper.sh
timeout = 1
```

In `/path/to/helper.sh`:

```
#!/bin/bash
pass show path/to/password | head -n 1
```

## 6.1.2 CLI

### Objects and actions

The `gitlab` command expects two mandatory arguments. The first one is the type of object that you want to manipulate. The second is the action that you want to perform. For example:

```
$ gitlab project list
```

Use the `--help` option to list the available object types and actions:

```
$ gitlab --help
$ gitlab project --help
```

Some actions require additional parameters. Use the `--help` option to list mandatory and optional arguments for an action:

```
$ gitlab project create --help
```

## Optional arguments

Use the following optional arguments to change the behavior of `gitlab`. These options must be defined before the mandatory arguments.

**--verbose, -v** Outputs detail about retrieved objects. Available for legacy (default) output only.

**--config-file, -c** Path to a configuration file.

**--gitlab, -g** ID of a GitLab server defined in the configuration file.

**--output, -o** Output format. Defaults to a custom format. Can also be `yaml` or `json`.

---

**Important:** The [PyYAML package](#) is required to use the `yaml` output option. You need to install it explicitly using `pip install python-gitlab[yaml]`

---

**--fields, -f** Comma-separated list of fields to display (`yaml` and `json` output formats only). If not used, all the object fields are displayed.

Example:

```
$ gitlab -o yaml -f id,permissions -g elsewhere -c /tmp/gl.cfg project list
```

## Reading values from files

You can make `gitlab` read values from files instead of providing them on the command line. This is handy for values containing new lines for instance:

```
$ cat > /tmp/description << EOF
This is the description of my project.

It is obviously the best project around
EOF
$ gitlab project create --name SuperProject --description @/tmp/description
```

### 6.1.3 Enabling shell completion

To get completion, you'll need to install the package with the extra “completion”:

```
pip install python_gitlab[completion]
```

Add the appropriate command below to your shell's config file so that it is run on startup. You will likely have to restart or re-login for the completion to start working.

## Bash

```
eval "$(register-python-argcomplete gitlab)"
```

## tcsh

```
eval `register-python-argcomplete --shell tcsh gitlab`
```

## fish

```
register-python-argcomplete --shell fish gitlab | .
```

## Zsh

**Warning:** Zsh completion support is broken right now in the argcomplete python package. Perhaps it will be fixed in a future release of argcomplete at which point the following instructions will enable completion in zsh.

To activate completions for zsh you need to have bashcompinit enabled in zsh:

```
autoload -U bashcompinit  
bashcompinit
```

Afterwards you can enable completion for gitlab:

```
eval "$(register-python-argcomplete gitlab)"
```

## 6.2 Getting started with the API

python-gitlab only supports GitLab API v4.

### 6.2.1 `gitlab.Gitlab` class

To connect to GitLab.com or another GitLab instance, create a `gitlab.Gitlab` object:

```
import gitlab

# anonymous read-only access for public resources (GitLab.com)
gl = gitlab.Gitlab()

# anonymous read-only access for public resources (self-hosted GitLab instance)
gl = gitlab.Gitlab('https://gitlab.example.com')

# private token or personal token authentication (GitLab.com)
gl = gitlab.Gitlab(private_token='JVNSESs8EwWRx5yDxM5q')
```

(continues on next page)

(continued from previous page)

```

# private token or personal token authentication (self-hosted GitLab instance)
gl = gitlab.Gitlab(url='https://gitlab.example.com', private_token='JVNSEs8EwWRx5yDxM5q
˓→')

# oauth token authentication
gl = gitlab.Gitlab('https://gitlab.example.com', oauth_token='my_long_token_here')

# job token authentication (to be used in CI)
# bear in mind the limitations of the API endpoints it supports:
# https://docs.gitlab.com/ee/ci/jobs/ci_job_token.html
import os
gl = gitlab.Gitlab('https://gitlab.example.com', job_token=os.environ['CI_JOB_TOKEN'])

# Define your own custom user agent for requests
gl = gitlab.Gitlab('https://gitlab.example.com', user_agent='my-package/1.0.0')

# make an API request to create the gl.user object. This is mandatory if you
# use the username/password authentication - not required for token authentication,
# and will not work with job tokens.
gl.auth()

```

You can also use configuration files to create `gitlab.Gitlab` objects:

```
gl = gitlab.Gitlab.from_config('somewhere', ['/tmp/gl.cfg'])
```

See the [Configuration](#) section for more information about configuration files.

**Warning:** Note that a url that results in 301/302 redirects will raise an error, so it is highly recommended to use the final destination in the `url` field. For example, if the GitLab server you are using redirects requests from http to https, make sure to use the `https://` protocol in the URL definition.

A URL that redirects using 301/302 (rather than 307/308) will most likely cause malformed POST and PUT requests. python-gitlab will therefore raise a `RedirectionError` when it encounters a redirect which it believes will cause such an error, to avoid confusion between successful GET and failing POST/PUT requests on the same instance.

## Note on password authentication

The `/session` API endpoint used for username/password authentication has been removed from GitLab in version 10.2, and is not available on `gitlab.com` anymore. Personal token authentication is the preferred authentication method.

If you need username/password authentication, you can use cookie-based authentication. You can use the web UI form to authenticate, retrieve cookies, and then use a custom `requests.Session` object to connect to the GitLab API. The following code snippet demonstrates how to automate this: <https://gist.github.com/gocentek/bd4c3fbf8a6ce226ebddc4aad6b46c0a>.

See issue 380 for a detailed discussion.

## 6.2.2 Managers

The `gitlab.Gitlab` class provides managers to access the GitLab resources. Each manager provides a set of methods to act on the resources. The available methods depend on the resource type.

Examples:

```
# list all the projects
projects = gl.projects.list()
for project in projects:
    print(project)

# get the group with id == 2
group = gl.groups.get(2)
for project in group.projects.list():
    print(project)

# create a new user
user_data = {'email': 'jen@foo.com', 'username': 'jen', 'name': 'Jen'}
user = gl.users.create(user_data)
print(user)
```

You can list the mandatory and optional attributes for object creation and update with the manager's `get_create_attrs()` and `get_update_attrs()` methods. They return 2 tuples, the first one is the list of mandatory attributes, the second one is the list of optional attribute:

```
# v4 only
print(gl.projects.get_create_attrs())
(('name',), ('path', 'namespace_id', ...))
```

The attributes of objects are defined upon object creation, and depend on the GitLab API itself. To list the available information associated with an object use the `attributes` attribute:

```
project = gl.projects.get(1)
print(project.attributes)
```

Some objects also provide managers to access related GitLab resources:

```
# list the issues for a project
project = gl.projects.get(1)
issues = project.issues.list()
```

`python-gitlab` allows to send any data to the GitLab server when making queries. In case of invalid or missing arguments `python-gitlab` will raise an exception with the GitLab server error message:

```
>>> gl.projects.list(sort='invalid value')
...
GitlabListError: 400: sort does not have a valid value
```

You can use the `query_parameters` argument to send arguments that would conflict with python or `python-gitlab` when using them as kwargs:

```
gl.user_activities.list(from='2019-01-01') ## invalid

gl.user_activities.list(query_parameters={'from': '2019-01-01'}) # OK
```

### 6.2.3 Gitlab Objects

You can update or delete a remote object when it exists locally:

```
# update the attributes of a resource
project = gl.projects.get(1)
project.wall_enabled = False
# don't forget to apply your changes on the server:
project.save()

# delete the resource
project.delete()
```

Some classes provide additional methods, allowing more actions on the GitLab resources. For example:

```
# star a git repository
project = gl.projects.get(1)
project.star()
```

You can print a Gitlab Object. For example:

```
project = gl.projects.get(1)
print(project)

# Or in a prettier format.
project pprint()

# Or explicitly via `pformat()`. This is equivalent to the above.
print(project.pformat())
```

You can also extend the object if the parameter isn't explicitly listed. For example, if you want to update a field that has been newly introduced to the Gitlab API, setting the value on the object is accepted:

```
issues = project.issues.list(state='opened')
for issue in issues:
    issue.my_super_awesome_feature_flag = "random_value"
    issue.save()
```

### 6.2.4 Base types

The `gitlab` package provides some base types.

- `gitlab.Gitlab` is the primary class, handling the HTTP requests. It holds the GitLab URL and authentication information.
- `gitlab.base.RESTObject` is the base class for all the GitLab v4 objects. These objects provide an abstraction for GitLab resources (projects, groups, and so on).
- `gitlab.base.RESTManager` is the base class for v4 objects managers, providing the API to manipulate the resources and their attributes.

## 6.2.5 Lazy objects

To avoid useless API calls to the server you can create lazy objects. These objects are created locally using a known ID, and give access to other managers and methods.

The following example will only make one API call to the GitLab server to star a project (the previous example used 2 API calls):

```
# star a git repository
project = gl.projects.get(1, lazy=True)  # no API call
project.star()  # API call
```

## 6.2.6 Pagination

You can use pagination to iterate over long lists. All the Gitlab objects listing methods support the page and per\_page parameters:

```
ten_first_groups = gl.groups.list(page=1, per_page=10)
```

**Warning:** The first page is page 1, not page 0.

By default GitLab does not return the complete list of items. Use the all parameter to get all the items when using listing methods:

```
all_groups = gl.groups.list(all=True)
all_owned_projects = gl.projects.list(owned=True, all=True)
```

You can define the per\_page value globally to avoid passing it to every list() method call:

```
gl = gitlab.Gitlab(url, token, per_page=50)
```

Gitlab allows to also use keyset pagination. You can supply it to your project listing, but you can also do so globally. Be aware that GitLab then also requires you to only use supported order options. At the time of writing, only order\_by="id" works.

```
gl = gitlab.Gitlab(url, token, pagination="keyset", order_by="id", per_page=100)
gl.projects.list()
```

Reference: <https://docs.gitlab.com/ce/api/README.html#keyset-based-pagination>

list() methods can also return a generator object which will handle the next calls to the API when required. This is the recommended way to iterate through a large number of items:

```
items = gl.groups.list(as_list=False)
for item in items:
    print(item.attributes)
```

The generator exposes extra listing information as received from the server:

- current\_page: current page number (first page is 1)
- prev\_page: if None the current page is the first one
- next\_page: if None the current page is the last one

- `per_page`: number of items per page
- `total_pages`: total number of pages available. This may be a `None` value.
- `total`: total number of items in the list. This may be a `None` value.

**Note:** For performance reasons, if a query returns more than 10,000 records, GitLab does not return the `total_pages` or `total` headers. In this case, `total_pages` and `total` will have a value of `None`.

For more information see: [https://docs.gitlab.com/ee/user/gitlab\\_com/index.html#pagination-response-headers](https://docs.gitlab.com/ee/user/gitlab_com/index.html#pagination-response-headers)

## 6.2.7 Sudo

If you have the administrator status, you can use `sudo` to act as another user. For example:

```
p = gl.projects.create({'name': 'awesome_project'}, sudo='user1')
```

## 6.2.8 Advanced HTTP configuration

`python-gitlab` relies on `requests.Session` objects to perform all the HTTP requests to the Gitlab servers.

You can provide your own `Session` object with custom configuration when you create a `Gitlab` object.

### Context manager

You can use `Gitlab` objects as context managers. This makes sure that the `requests.Session` object associated with a `Gitlab` instance is always properly closed when you exit a `with` block:

```
with gitlab.Gitlab(host, token) as gl:
    gl.projects.list()
```

**Warning:** The context manager will also close the custom `Session` object you might have used to build the `Gitlab` instance.

### Proxy configuration

The following sample illustrates how to define a proxy configuration when using `python-gitlab`:

```
import gitlab
import requests

session = requests.Session()
session.proxies = {
    'https': os.environ.get('https_proxy'),
    'http': os.environ.get('http_proxy'),
}
gl = gitlab.Gitlab(url, token, api_version=4, session=session)
```

Reference: <https://2.python-requests.org/en/master/user/advanced/#proxies>

## SSL certificate verification

python-gitlab relies on the CA certificate bundle in the *certifi* package that comes with the requests library.

If you need python-gitlab to use your system CA store instead, you can provide the path to the CA bundle in the *REQUESTS\_CA\_BUNDLE* environment variable.

Reference: <https://2.python-requests.org/en/master/user/advanced/#ssl-cert-verification>

## Client side certificate

The following sample illustrates how to use a client-side certificate:

```
import gitlab
import requests

session = requests.Session()
session.cert = ('/path/to/client.cert', '/path/to/client.key')
gl = gitlab.gitlab(url, token, api_version=4, session=session)
```

Reference: <https://2.python-requests.org/en/master/user/advanced/#client-side-certificates>

## Rate limits

python-gitlab obeys the rate limit of the GitLab server by default. On receiving a 429 response (Too Many Requests), python-gitlab sleeps for the amount of time in the Retry-After header that GitLab sends back. If GitLab does not return a response with the Retry-After header, python-gitlab will perform an exponential backoff.

If you don't want to wait, you can disable the rate-limiting feature, by supplying the *obey\_rate\_limit* argument.

```
import gitlab
import requests

gl = gitlab.gitlab(url, token, api_version=4)
gl.projects.list(all=True, obey_rate_limit=False)
```

If you do not disable the rate-limiting feature, you can supply a custom value for *max\_retries*; by default, this is set to 10. To retry without bound when throttled, you can set this parameter to -1. This parameter is ignored if *obey\_rate\_limit* is set to False.

```
import gitlab
import requests

gl = gitlab.gitlab(url, token, api_version=4)
gl.projects.list(all=True, max_retries=12)
```

**Warning:** You will get an Exception, if you then go over the rate limit of your GitLab instance.

## Transient errors

GitLab server can sometimes return a transient HTTP error. python-gitlab can automatically retry in such case, when `retry_transient_errors` argument is set to True. When enabled, HTTP error codes 500 (Internal Server Error), 502 (502 Bad Gateway), 503 (Service Unavailable), and 504 (Gateway Timeout) are retried. It will retry until reaching the `max_retries` value. By default, `retry_transient_errors` is set to `False` and an exception is raised for these errors.

```
import gitlab
import requests

gl = gitlab.gitlab(url, token, api_version=4)
gl.projects.list(all=True, retry_transient_errors=True)
```

The default `retry_transient_errors` can also be set on the `Gitlab` object and overridden by individual API calls.

```
import gitlab
import requests
gl = gitlab.gitlab(url, token, api_version=4, retry_transient_errors=True)
gl.projects.list(all=True)                                # retries due to default value
gl.projects.list(all=True, retry_transient_errors=False) # does not retry
```

## Timeout

`python-gitlab` will by default use the `timeout` option from its configuration for all requests. This is passed downwards to the `requests` module at the time of making the HTTP request. However if you would like to override the global timeout parameter for a particular call, you can provide the `timeout` parameter to that API invocation:

```
import gitlab

gl = gitlab.gitlab(url, token, api_version=4)
gl.projects.import_github(ACCESS_TOKEN, 123456, "root", timeout=120.0)
```

### 6.2.9 Attributes in updated objects

When methods manipulate an existing object, such as with `refresh()` and `save()`, the object will only have attributes that were returned by the server. In some cases, such as when the initial request fetches attributes that are needed later for additional processing, this may not be desired:

```
project = gl.projects.get(1, statistics=True)
project.statistics

project.refresh()
project.statistics # AttributeError
```

To avoid this, either copy the object/attributes before calling `refresh()/save()` or subsequently perform another `get()` call as needed, to fetch the attributes you want.

## 6.4 API examples

### 6.4.1 Access requests

Users can request access to groups and projects.

When access is granted the user should be given a numerical access level. The following constants are provided to represent the access levels:

- `gitlab.const.GUEST_ACCESS: 10`
- `gitlab.const.REPORTER_ACCESS: 20`
- `gitlab.const.DEVELOPER_ACCESS: 30`
- `gitlab.const.MAINTAINER_ACCESS: 40`
- `gitlab.const.OWNER_ACCESS: 50`

```

Approve an access request:

```
ar.approve()  # defaults to DEVELOPER level  
ar.approve(access_level=gitlab.const.MAINTAINER_ACCESS)  # explicitly set access level
```

Deny (delete) an access request:

```
project.accessrequests.delete(user_id)  
group.accessrequests.delete(user_id)  
# or  
ar.delete()
```

## 6.4.9 Commits

### Commits

### Reference

- v4 API:

  - `gitlab.v4.objects.ProjectCommitManager`
  - `gitlab.v4.objects.Project.commits`

### Examples

List the commits for a project:

```

commits = project.commits.list(ref_name='my_branch')
commits = project.commits.list(since='2016-01-01T00:00:00Z')
```

---

**Note:** The available `all` listing argument conflicts with the `python-gitlab` argument. Use `query_parameters` to avoid the conflict:

```
commits = project.commits.list(all=True,
                               query_parameters={'ref_name': 'my_branch'})
```

```
# See https://docs.gitlab.com/ce/api/commits.html#create-a-commit-with-multiple-files-and-actions
# for actions detail
data = {
    'branch': 'main',
    'commit_message': 'blah blah blah',
    'actions': [
        {
            'action': 'create',
            'file_path': 'README.rst',
            'content': open('path/to/file.rst').read(),
        },
        {
            # Binary files need to be base64 encoded
            'action': 'create',
            'file_path': 'logo.png',
            'content': base64.b64encode(open('logo.png').read()),
            'encoding': 'base64',
        }
    ]
}
```

(continues on next page)

commit = commit.comments.create({'note': 'This is another comment',
                                 'line': 12,
                                 'line_type': 'new',

## 6.4.11 Deploy tokens

Deploy tokens allow read-only access to your repository and registry images without having a user and a password.

### Deploy tokens

This endpoint requires admin access.

### Reference

- v4 API:
  - `gitlab.v4.objects.DeployToken`
  - `gitlab.v4.objects.DeployTokenManager`
  - `gitlab.Gitlab.deploytokens`
- GitLab API: [https://docs.gitlab.com/ce/api/deploy\\_tokens.html](https://docs.gitlab.com/ce/api/deploy_tokens.html)

### Examples

Use the `list()` method to list all deploy tokens across the GitLab instance.

```
# List deploy tokens
deploy_tokens = gl.deploytokens.list()
```

### Project deploy tokens

This endpoint requires project maintainer access or higher.

### Reference

- v4 API:
  - `gitlab.v4.objects.ProjectDeployToken`
  - `gitlab.v4.objects.ProjectDeployTokenManager`
  - `gitlab.v4.objects.Project.deploytokens`
- GitLab API: [https://docs.gitlab.com/ce/api/deploy\\_tokens.html#project-deploy-tokens](https://docs.gitlab.com/ce/api/deploy_tokens.html#project-deploy-tokens)

## Examples

List the deploy tokens for a project:

```
deploy_tokens = project.deploytokens.list()
```

Get a deploy token for a project by id:

```
deploy_token = project.deploytokens.get(deploy_token_id)
```

Create a new deploy token to access registry images of a project:

In addition to required parameters `name` and `scopes`, this method accepts the following parameters:

- `expires_at` Expiration date of the deploy token. Does not expire if no value is provided.
- `username` Username for deploy token. Default is `gitlab+deploy-token-{n}`

```
deploy_token = project.deploytokens.create({'name': 'token1', 'scopes': ['read_registry'
    ↵'], 'username': '', 'expires_at': ''})
# show its id
print(deploy_token.id)
# show the token value. Make sure you save it, you won't be able to access it again.
print(deploy_token.token)
```

**Warning:** With GitLab 12.9, even though `username` and `expires_at` are not required, they always have to be passed to the API. You can set them to empty strings, see: <https://gitlab.com/gitlab-org/gitlab/-/issues/211878>. Also, the `username`'s value is ignored by the API and will be overridden with `gitlab+deploy-token-{n}`, see: <https://gitlab.com/gitlab-org/gitlab/-/issues/211963> These issues were fixed in GitLab 12.10.

Remove a deploy token from the project:

```
deploy_token.delete()
# or
project.deploytokens.delete(deploy_token.id)
```

## Group deploy tokens

### Reference

- v4 API:
  - `gitlab.v4.objects.GroupDeployToken`
  - `gitlab.v4.objects.GroupDeployTokenManager`
  - `gitlab.v4.objects.Group.deploytokens`
- GitLab API: [https://docs.gitlab.com/ce/api/deploy\\_tokens.html#group-deploy-tokens](https://docs.gitlab.com/ce/api/deploy_tokens.html#group-deploy-tokens)

## Examples

List the deploy tokens for a group:

```
deploy_tokens = group.deploytokens.list()
```

Get a deploy token for a group by id:

```
deploy_token = group.deploytokens.get(deploy_token_id)
```

Create a new deploy token to access all repositories of all projects in a group:

In addition to required parameters `name` and `scopes`, this method accepts the following parameters:

- `expires_at` Expiration date of the deploy token. Does not expire if no value is provided.
- `username` Username for deploy token. Default is `gitlab+deploy-token-{n}`

```
deploy_token = group.deploytokens.create({'name': 'token1', 'scopes': ['read_repository'
    ↵'], 'username': '', 'expires_at': ''})
# show its id
print(deploy_token.id)
```

**Warning:** With GitLab 12.9, even though `username` and `expires_at` are not required, they always have to be passed to the API. You can set them to empty strings, see: <https://gitlab.com/gitlab-org/gitlab/-/issues/211878>. Also, the `username`'s value is ignored by the API and will be overridden with `gitlab+deploy-token-{n}`, see: <https://gitlab.com/gitlab-org/gitlab/-/issues/211963> These issues were fixed in GitLab 12.10.

Remove a deploy token from the group:

```
deploy_token.delete()
# or
group.deploytokens.delete(deploy_token.id)
```

```

Get a single deployment:

```
deployment = project.deployments.get(deployment_id)
```

Create a new deployment:

```
deployment = project.deployments.create({

- GitLab API: <https://docs.gitlab.com/ce/api/discussions.html>

### Examples

List the discussions for a resource (issue, merge request, snippet or commit):

```
discussions = resource.discussions.list()
```

Get a single discussion:

```
discussion = resource.discussions.get(discussion_id)
```

You can access the individual notes in the discussion through the `notes` attribute. It holds a list of notes in chronological order:

```
# ``resource.notes`` is a DiscussionNoteManager, so we need to get the
# object notes using ```attributes````
for note in discussion.attributes['notes']:
    print(note['body'])
```

**Note:** The notes are dicts, not objects.

You can add notes to existing discussions:

```
new_note = discussion.notes.create({'body': 'Episode IV: A new note'})
```

You can get and update a single note using the \*DiscussionNote resources:

```
discussion = resource.discussions.get(discussion_id)
# Get the latest note's id
note_id = discussion.attributes['notes'][-1]['id']
last_note = discussion.notes.get(note_id)
last_note.body = 'Updated comment'
last_note.save()
```

Create a new discussion:

```
discussion = resource.discussions.create({'body': 'First comment of discussion'})
```

You can comment on merge requests and commit diffs. Provide the `position` dict to define where the comment should appear in the diff:

```
mr_diff = mr.diffs.get(diff_id)
mr.discussions.create({'body': 'Note content',
                      'position': {
                          'base_sha': mr_diff.base_commit_sha,
                          'start_sha': mr_diff.start_commit_sha,
                          'head_sha': mr_diff.head_commit_sha,
                          'position_type': 'text',
                          'new_line': 1,
                          'old_path': 'README.rst',
                          'new_path': 'README.rst'}
                     })
```

Resolve / unresolve a merge request discussion:

```
mr_d = mr.discussions.get(d_id)
mr_d.resolved = True # True to resolve, False to unresolve
mr_d.save()
```

Delete a comment:

```
discussions.notes.delete(note_id)
# or
note.delete()
```

## 6.4.19 Groups

### Groups

### Reference

- v4 API:
  - `gitlab.v4.objects.Group`
  - `gitlab.v4.objects.GroupManager`
  - `gitlab.Gitlab.groups`
- GitLab API: <https://docs.gitlab.com/ce/api/groups.html>

### Examples

List the groups:

```
groups = gl.groups.list()
```

Get a group's detail:

```
group = gl.groups.get(group_id)
```

List a group's projects:

```
projects = group.projects.list()
```

---

**Note:** `GroupProject` objects returned by this API call are very limited, and do not provide all the features of `Project` objects. If you need to manipulate projects, create a new `Project` object:

```
first_group_project = group.projects.list()[0]
manageable_project = gl.projects.get(first_group_project.id, lazy=True)
```

---

You can filter and sort the result using the following parameters:

- `archived`: limit by archived status
- `visibility`: limit by visibility. Allowed values are `public`, `internal` and `private`
- `search`: limit to groups matching the given value
- `order_by`: sort by criteria. Allowed values are `id`, `name`, `path`, `created_at`, `updated_at` and `last_activity_at`
- `sort`: sort order: `asc` or `desc`
- `ci_enabled_first`: return CI enabled groups first
- `include_subgroups`: include projects in subgroups

Create a group:

```
group = gl.groups.create({'name': 'group1', 'path': 'group1'})
```

Create a subgroup under an existing group:

```
subgroup = gl.groups.create({'name': 'subgroup1', 'path': 'subgroup1', 'parent_id':  
    ↵parent_group_id})
```

Update a group:

```
group.description = 'My awesome group'  
group.save()
```

Set the avatar image for a group:

```
# the avatar image can be passed as data (content of the file) or as a file  
# object opened in binary mode  
group.avatar = open('path/to/file.png', 'rb')  
group.save()
```

Remove a group:

```
gl.groups.delete(group_id)  
# or  
group.delete()
```

Share/unshare the group with a group:

```
group.share(group2.id, gitlab.const.DEVELOPER_ACCESS)  
group.unshare(group2.id)
```

## Import / Export

You can export groups from gitlab, and re-import them to create new groups.

## Reference

- v4 API:
  - *gitlab.v4.objects.GroupExport*
  - *gitlab.v4.objects.GroupExportManager*
  - *gitlab.v4.objects.Group.exports*
  - *gitlab.v4.objects.GroupImport*
  - *gitlab.v4.objects.GroupImportManager*
  - *gitlab.v4.objects.Group.imports*
  - *gitlab.v4.objects.GroupManager.import\_group*
- GitLab API: [https://docs.gitlab.com/ce/api/group\\_import\\_export.html](https://docs.gitlab.com/ce/api/group_import_export.html)

## Examples

A group export is an asynchronous operation. To retrieve the archive generated by GitLab you need to:

1. Create an export using the API
2. Wait for the export to be done
3. Download the result

**Warning:** Unlike the Project Export API, GitLab does not provide an export\_status for Group Exports. It is up to the user to ensure the export is finished.

However, Group Exports only contain metadata, so they are much faster than Project Exports.

```
# Create the export
group = gl.groups.get(my_group)
export = group.exports.create()

# Wait for the export to finish
time.sleep(3)

# Download the result
with open('/tmp/export.tgz', 'wb') as f:
    export.download(streamed=True, action=f.write)
```

Import the group:

```
with open('/tmp/export.tgz', 'rb') as f:
    gl.groups.import_group(f, path='imported-group', name="Imported Group")
```

## Subgroups

### Reference

- v4 API:
  - `gitlab.v4.objects.GroupSubgroup`
  - `gitlab.v4.objects.GroupSubgroupManager`
  - `gitlab.v4.objects.Group.subgroups`

## Examples

List the subgroups for a group:

```
subgroups = group.subgroups.list()
```

**Note:** The GroupSubgroup objects don't expose the same API as the Group objects. If you need to manipulate a subgroup as a group, create a new Group object:

```
real_group = gl.groups.get(subgroup_id, lazy=True)
real_group.issues.list()
```

---

## Descendant Groups

### Reference

- v4 API:
  - *gitlab.v4.objects.GroupDescendantGroup*
  - *gitlab.v4.objects.GroupDescendantGroupManager*
  - *gitlab.v4.objects.Group.descendant\_groups*

### Examples

List the descendant groups of a group:

```
descendant_groups = group.descendant_groups.list()
```

---

**Note:** Like the GroupSubgroup objects described above, GroupDescendantGroup objects do not expose the same API as the Group objects. Create a new Group object instead if needed, as shown in the subgroup example.

---

## Group custom attributes

### Reference

- v4 API:
  - *gitlab.v4.objects.GroupCustomAttribute*
  - *gitlab.v4.objects.GroupCustomAttributeManager*
  - *gitlab.v4.objects.Group.customattributes*
- GitLab API: [https://docs.gitlab.com/ce/api/custom\\_attributes.html](https://docs.gitlab.com/ce/api/custom_attributes.html)

### Examples

List custom attributes for a group:

```
attrs = group.customattributes.list()
```

---

Get a custom attribute for a group:

```
attr = group.customattributes.get(attr_key)
```

---

Set (create or update) a custom attribute for a group:

```
attr = group.customattributes.set(attr_key, attr_value)
```

Delete a custom attribute for a group:

```
attr.delete()  
# or  
group.customattributes.delete(attr_key)
```

Search groups by custom attribute:

```
group.customattributes.set('role': 'admin')  
gl.groups.list(custom_attributes={'role': 'admin'})
```

## Group members

The following constants define the supported access levels:

- `gitlab.const.GUEST_ACCESS = 10`
- `gitlab.const.REPORTER_ACCESS = 20`
- `gitlab.const.DEVELOPER_ACCESS = 30`
- `gitlab.const.MAINTAINER_ACCESS = 40`
- `gitlab.const.OWNER_ACCESS = 50`

## Reference

- v4 API:
  - `gitlab.v4.objects.GroupMember`

  - `gitlab.v4.objects.Group.members_all`
  - `gitlab.v4.objects.Group.billable_members`
- GitLab API: <https://docs.gitlab.com/ce/api/members.html>

Billable group members are only available in GitLab EE.

## Examples

List only direct group members:

```
members = group.members.list()
```

List the group members recursively (including inherited members through ancestor groups):

```
members = group.members_all.list(all=True)
```

Get only direct group member:

```
members = group.members.get(member_id)
```

Get a member of a group, including members inherited through ancestor groups:

```
members = group.members_all.get(member_id)
```

Add a member to the group:

```
member = group.members.create({'user_id': user_id,
                               'access_level': gitlab.const.GUEST_ACCESS})
```

Update a member (change the access level):

```
member.access_level = gitlab.const.DEVELOPER_ACCESS
member.save()
```

Remove a member from the group:

```
group.members.delete(member_id)
# or
member.delete()
```

List billable members of a group (top-level groups only):

```
billable_members = group.billable_members.list()
```

Remove a billable member from the group:

```
group.billable_members.delete(member_id)
# or
billable_member.delete()
```

List memberships of a billable member:

```
billable_member.memberships.list()
```

## LDAP group links

Add an LDAP group link to an existing GitLab group:

```
group.add_ldap_group_link(ldap_group_cn, gitlab.const.DEVELOPER_ACCESS, 'ldapmain')
```

Remove a link:

```
group.delete_ldap_group_link(ldap_group_cn, 'ldapmain')
```

Sync the LDAP groups:

```
group.ldap_sync()
```

You can use the `ldapgroups` manager to list available LDAP groups:

```
# listing (supports pagination)
ldap_groups = gl.ldapgroups.list()

# filter using a group name
ldap_groups = gl.ldapgroups.list(search='foo')

# list the groups for a specific LDAP provider
ldap_groups = gl.ldapgroups.list(search='foo', provider='ldapmain')
```

## Groups hooks

  - `gitlab.v4.objects.GroupHookManager`
  - `gitlab.v4.objects.Group.hooks`
- GitLab API: <https://docs.gitlab.com/ce/api/groups.html#hooks>

### Examples

List the group hooks:

```
hooks = group.hooks.list()
```

Get a group hook:

```
hook = group.hooks.get(hook_id)
```

Create a group hook:

```
hook = group.hooks.create({'url': 'http://my/action/url', 'push_events': 1})
```

Update a group hook:

```
hook.push_events = 0
hook.save()
```

Delete a group hook:

```
group.hooks.delete(hook_id)
# or
hook.delete()
```

## 6.4.20 Group Access Tokens

```
access_tokens = gl.groups.get(1, lazy=True).access_tokens.list()
print(access_tokens[0].name)
```

Create group access token:

```
access_token = gl.groups.get(1).access_tokens.create({"name": "test", "scopes": ["api"]})
```

Revoke a group access tokens:

```
gl.groups.get(1).access_tokens.delete(42)
# or
access_token.delete()
```

## 6.4.21 Issues

### Reported issues

### Reference

- v4 API:
  - `gitlab.v4.objects.Issue`
  - `gitlab.v4.objects.IssueManager`

- `gitlab.Gitlab.issues`
- GitLab API: <https://docs.gitlab.com/ce/api/issues.html>

## Examples

List the issues:

```
issues = gl.issues.list()
```

Use the `state` and `label` parameters to filter the results. Use the `order_by` and `sort` attributes to sort the results:

```
open_issues = gl.issues.list(state='opened')
closed_issues = gl.issues.list(state='closed')
tagged_issues = gl.issues.list(labels=['foo', 'bar'])
```

---

**Note:** It is not possible to edit or delete Issue objects. You need to create a `ProjectIssue` object to perform changes:

```
issue = gl.issues.list()[0]
project = gl.projects.get(issue.project_id, lazy=True)
editable_issue = project.issues.get(issue.iid, lazy=True)
editable_issue.title = updated_title
editable_issue.save()
```

## Examples

List the group issues:

```
issues = group.issues.list()
# Filter using the state, labels and milestone parameters
issues = group.issues.list(milestone='1.0', state='opened')
# Order using the order_by and sort parameters
issues = group.issues.list(order_by='created_at', sort='desc')
```

---

**Note:** It is not possible to edit or delete `GroupIssue` objects. You need to create a `ProjectIssue` object to perform changes:

```
issue = group.issues.list()[0]
project = gl.projects.get(issue.project_id, lazy=True)
editable_issue = project.issues.get(issue.iid, lazy=True)
editable_issue.title = updated_title
editable_issue.save()
```

---

## Project issues

  - `gitlab.v4.objects.ProjectIssueManager`
  - `gitlab.v4.objects.Project.issues`
- GitLab API: <https://docs.gitlab.com/ce/api/issues.html>

### Examples

List the project issues:

```
issues = project.issues.list()
# Filter using the state, labels and milestone parameters
issues = project.issues.list(milestone='1.0', state='opened')
# Order using the order_by and sort parameters
issues = project.issues.list(order_by='created_at', sort='desc')
```

Get a project issue:

```
issue = project.issues.get(issue_iid)
```

Create a new issue:

```
issue = project.issues.create({'title': 'I have a bug',
                               'description': 'Something useful here.'})
```

Update an issue:

```
issue.labels = ['foo', 'bar']
issue.save()
```

Close / reopen an issue:

```
# close an issue
issue.state_event = 'close'
issue.save()
# reopen it
issue.state_event = 'reopen'
issue.save()
```

Delete an issue (admin or project owner only):

```
project.issues.delete(issue_id)
# pr
issue.delete()
```

Assign the issues:

```
issue = gl.issues.list()[0]
issue.assignee_ids = [25, 10, 31, 12]
issue.save()
```

---

**Note:** The Gitlab API explicitly references that the `assignee_id` field is deprecated, so using a list of user IDs for `assignee_ids` is how to assign an issue to a user(s).

---

Subscribe / unsubscribe from an issue:

```
issue.subscribe()
issue.unsubscribe()
```

Move an issue to another project:

```
issue.move(other_project_id)
```

Make an issue as todo:

```
issue.todo()
```

Get time tracking stats:

```
issue.time_stats()
```

On recent versions of Gitlab the time stats are also returned as an issue object attribute:

```
issue = project.issue.get(iid)
print(issue.attributes['time_stats'])
```

Set a time estimate for an issue:

```
issue.time_estimate('3h30m')
```

Reset a time estimate for an issue:

```
issue.reset_time_estimate()
```

Add spent time for an issue:

```
issue.add_spent_time('3h30m')
```

Reset spent time for an issue:

```
issue.reset_spent_time()
```

Get user agent detail for the issue (admin only):

```
detail = issue.user_agent_detail()
```

Get the list of merge requests that will close an issue when merged:

```
mrs = issue.closed_by()
```

Get the merge requests related to an issue:

```
mrs = issue.related_merge_requests()
```

Get the list of participants:

```
users = issue.participants()
```

- GitLab API: [https://docs.gitlab.com/ee/api/issue\\_links.html](https://docs.gitlab.com/ee/api/issue_links.html) (EE feature)

### Examples

List the issues linked to i1:

```
links = i1.links.list()
```

Link issue i1 to issue i2:

```
data = {  
    'target_project_id': i2.project_id,  
    'target_issue_iid': i2.iid  
}  
src_issue, dest_issue = i1.links.create(data)
```

---

**Note:** The `create()` method returns the source and destination `ProjectIssue` objects, not a `ProjectIssueLink` object.

---

Delete a link:

```
i1.links.delete(issue_link_id)
```

## 6.4.23 Issue boards

### Boards

Boards are a visual representation of existing issues for a project or a group. Issues can be moved from one list to the other to track progress and help with priorities.

#### Reference

- v4 API:
  - `gitlab.v4.objects.ProjectBoard`
  - `gitlab.v4.objects.ProjectBoardManager`
  - `gitlab.v4.objects.Project.boards`
  - `gitlab.v4.objects.GroupBoard`

- GitLab API:
  - <https://docs.gitlab.com/ce/api/boards.html>
  - [https://docs.gitlab.com/ce/api/group\\_boards.html](https://docs.gitlab.com/ce/api/group_boards.html)

## Examples

Get the list of existing boards for a project or a group:

```
# item is a Project or a Group
boards = project_or_group.boards.list()
```

Get a single board for a project or a group:

```
board = project_or_group.boards.get(board_id)
```

Create a board:

```
board = project_or_group.boards.create({'name': 'new-board'})
```

---

**Note:** Board creation is not supported in the GitLab CE edition.

---

Delete a board:

```
board.delete()
# or
project_or_group.boards.delete(board_id)
```

---

**Note:** Board deletion is not supported in the GitLab CE edition.

---

## Board lists

Boards are made of lists of issues. Each list is associated to a label, and issues tagged with this label automatically belong to the list.

## Reference

- v4 API:
  - `gitlab.v4.objects.ProjectBoardList`
  - `gitlab.v4.objects.ProjectBoardListManager`
  - `gitlab.v4.objects.ProjectBoard.lists`
  - `gitlab.v4.objects.GroupBoardList`
  - `gitlab.v4.objects.GroupBoardListManager`
  - `gitlab.v4.objects.GroupBoard.lists`
- GitLab API:
  - <https://docs.gitlab.com/ce/api/boards.html>
  - [https://docs.gitlab.com/ce/api/group\\_boards.html](https://docs.gitlab.com/ce/api/group_boards.html)

## Examples

List the issue lists for a board:

```
b_lists = board.lists.list()
```

Get a single list:

```
b_list = board.lists.get(list_id)
```

Create a new list:

```
# First get a ProjectLabel
label = get_or_create_label()
# Then use its ID to create the new board list
b_list = board.lists.create({'label_id': label.id})
```

Change a list position. The first list is at position 0. Moving a list will set it at the given position and move the following lists up a position:

```
b_list.position = 2
b_list.save()
```

Delete a list:

```
b_list.delete()
```

## 6.4.24 Labels

### Project labels

  - `gitlab.v4.objects.ProjectLabelManager`
  - `gitlab.v4.objects.Project.labels`
- GitLab API: <https://docs.gitlab.com/ce/api/labels.html>

## Examples

List labels for a project:

```
labels = project.labels.list()
```

Create a label for a project:

```
label = project.labels.create({'name': 'foo', 'color': '#8899aa'})
```

Update a label for a project:

```
# change the name of the label:
label.new_name = 'bar'
label.save()
# change its color:
label.color = '#112233'
label.save()
```

Promote a project label to a group label:

```
label.promote()
```

Delete a label for a project:

```
project.labels.delete(label_id)
# or
label.delete()
```

Manage labels in issues and merge requests:

```
# Labels are defined as lists in issues and merge requests. The labels must
# exist.
issue = p.issues.create({'title': 'issue title',
                        'description': 'issue description',
                        'labels': ['foo']})
issue.labels.append('bar')
issue.save()
```

## Label events

Resource label events keep track about who, when, and which label was added or removed to an issuable.

Group epic label events are only available in the EE edition.

```
events = resource.resourcelabelevents.list()
```

Get a specific event for a resource:

```
event = resource.resourcelabelevents.get(event_id)
```

### 6.4.25 Notification settings

You can define notification settings globally, for groups and for projects. Valid levels are defined as constants:

- `gitlab.const.NOTIFICATION_LEVEL_DISABLED`
- `gitlab.const.NOTIFICATION_LEVEL_PARTICIPATING`
- `gitlab.const.NOTIFICATION_LEVEL_WATCH`
- `gitlab.const.NOTIFICATION_LEVEL_GLOBAL`
- `gitlab.const.NOTIFICATION_LEVEL_MENTION`
- `gitlab.const.NOTIFICATION_LEVEL_CUSTOM`

You get access to fine-grained settings if you use the `NOTIFICATION_LEVEL_CUSTOM` level.

## Reference

- v4 API:
  - `gitlab.v4.objects.NotificationSettings`
  - `gitlab.v4.objects.NotificationSettingsManager`
  - `gitlab.Gitlab.notificationsettings`

  - `gitlab.v4.objects.Project.notificationsettings`
- GitLab API: [https://docs.gitlab.com/ce/api/notification\\_settings.html](https://docs.gitlab.com/ce/api/notification_settings.html)

settings = gl.notificationsettings.get()
# for a group
settings = gl.groups.get(group_id).notificationsettings.get()
# for a project
settings = gl.projects.get(project_id).notificationsettings.get()
```

Update the notifications settings:

```
# use a predefined level
settings.level = gitlab.const.NOTIFICATION_LEVEL_WATCH

# create a custom setup
settings.level = gitlab.const.NOTIFICATION_LEVEL_CUSTOM
settings.save() # will create additional attributes, but not mandatory

settings.new_merge_request = True
settings.new_issue = True
settings.new_note = True
settings.save()
```

```
merge_trains = project.merge_trains.list(scope="active")
```

List completed (have been merged) merge trains for a project:

```
merge_trains = project.merge_trains.list(scope="complete")
```

## 6.4.27 Merge requests

You can use merge requests to notify a project that a branch is ready for merging. The owner of the target project can accept the merge request.

Merge requests are linked to projects, but they can be listed globally or for groups.

### Group and global listing

  - `gitlab.Gitlab.mergerequests`
- GitLab API: [https://docs.gitlab.com/ce/api/merge\\_requests.html](https://docs.gitlab.com/ce/api/merge_requests.html)

### Examples

```
mrs = gl.mergerequests.list()
```

```
mrs = gl.mergerequests.list(scope="all")
```

List the merge requests for a group:

```
group = gl.groups.get('mygroup')
mrs = group.mergerequests.list()
```

---

**Note:** It is not possible to edit or delete `MergeRequest` and `GroupMergeRequest` objects. You need to create a `ProjectMergeRequest` object to apply changes:

```
mr = group.mergerequests.list()[0]
project = gl.projects.get(mr.project_id, lazy=True)
editable_mr = project.mergerequests.get(mr.iid, lazy=True)
editable_mr.title = updated_title
editable_mr.save()
```

```

You can filter and sort the returned list with the following parameters:

- **state**: state of the MR. It can be one of `all`, `merged`, `opened`, `closed` or `locked`
- `order_by`: sort by `created_at` or `updated_at`
- `sort`: sort order (`asc` or `desc`)

You can find a full updated list of parameters here: [https://docs.gitlab.com/ee/api/merge\\_requests.html#list-merge-requests](https://docs.gitlab.com/ee/api/merge_requests.html#list-merge-requests)

For example:

```
mrs = project.mergerequests.list(state='merged', order_by='updated_at')
```

```
mr = project.mergerequests.get(mr_id)
```

```
mr = project.mergerequests.create({'source_branch': 'cool_feature',
                                    'target_branch': 'main',
                                    'title': 'merge cool feature',
                                    'labels': ['label1', 'label2']})
```

Update a MR:

```
mr.description = 'New description'
mr.labels = ['foo', 'bar']
mr.save()
```

Change the state of a MR (close or reopen):

```
mr.state_event = 'close' # or 'reopen'
mr.save()

```
changes = mr.changes()
```

```
mr.closes_issues()
```

Subscribe to / unsubscribe from a MR:

```

print(mr.attributes['time_stats'])
```

Set a time estimate for a merge request:

```
mr.time_estimate('3h30m')
```

```

Add spent time for a merge request:

```
mr.add_spent_time('3h30m')
```

Reset spent time for a merge request:

```
mr.reset_spent_time()
```

Get user agent detail for the issue (admin only):

```

```

Get status of a rebase for an MR:

```
mr = project.mergerequests.get(mr_id, include_rebase_in_progress=True)
print(mr.rebase_in_progress, mr.merge_error)

print(response['commit_id'])
```

  - <https://docs.gitlab.com/ee/api/users.html#create-a-personal-access-token>

## Examples

List personal access tokens:

```
access_tokens = gl.personal_access_tokens.list()  
print(access_tokens[0].name)
```

List personal access tokens from other user\_id (admin only):

```
access_tokens = gl.personal_access_tokens.list(user_id=25)
```

Revoke a personal access token fetched via list:

```
access_token = access_tokens[0]  
access_token.delete()
```

Revoke a personal access token by id:

```
gl.personal_access_tokens.delete(123)
```

Create a personal access token for a user (admin only):

```
user = gl.users.get(25, lazy=True)  
access_token = user.personal_access_tokens.create({"name": "test", "scopes": "api"})
```

---

**Note:** As you can see above, you can only create personal access tokens via the Users API, but you cannot revoke these objects directly. This is because the create API uses a different endpoint than the list and revoke APIs. You need to fetch the token via the list API first to revoke it.

As of 14.2, GitLab does not provide a GET API for single personal access tokens. You must use the list method to retrieve single tokens.

## 6.4.35 Pipelines and Jobs

### Project pipelines

A pipeline is a group of jobs executed by GitLab CI.

### Reference

- v4 API:
  - `gitlab.v4.objects.ProjectPipeline`
  - `gitlab.v4.objects.ProjectPipelineManager`
  - `gitlab.v4.objects.Project.pipelines`
- GitLab API: <https://docs.gitlab.com/ce/api/pipelines.html>

## Examples

List pipelines for a project:

```
pipelines = project.pipelines.list()
```

Get a pipeline for a project:

```
pipeline = project.pipelines.get(pipeline_id)
```

Get variables of a pipeline:

```
variables = pipeline.variables.list()
```

Create a pipeline for a particular reference with custom variables:

```
pipeline = project.pipelines.create({'ref': 'main', 'variables': [{key: 'MY_VARIABLE',  
    ↪ value: 'hello'}]})
```

Retry the failed builds for a pipeline:

```
pipeline.retry()
```

Cancel builds in a pipeline:

```
pipeline.cancel()
```

Delete a pipeline:

```
pipeline.delete()
```

## Triggers

Triggers provide a way to interact with the GitLab CI. Using a trigger a user or an application can run a new build/job for a specific commit.

## Reference

- v4 API:
  - *gitlab.v4.objects.ProjectTrigger*
  - *gitlab.v4.objects.ProjectTriggerManager*
  - *gitlab.v4.objects.Project.triggers*
- GitLab API: [https://docs.gitlab.com/ce/api/pipeline\\_triggers.html](https://docs.gitlab.com/ce/api/pipeline_triggers.html)

## Examples

List triggers:

```
triggers = project.triggers.list()
```

Get a trigger:

```
trigger = project.triggers.get(trigger_token)
```

Create a trigger:

```
trigger = project.triggers.create({'description': 'mytrigger'})
```

Remove a trigger:

```
project.triggers.delete(trigger_token)
# or
trigger.delete()
```

Full example with wait for finish:

```
def get_or_create_trigger(project):
    trigger_decription = 'my_trigger_id'
    for t in project.triggers.list():
        if t.description == trigger_decription:
            return t
    return project.triggers.create({'description': trigger_decription})

trigger = get_or_create_trigger(project)
pipeline = project.trigger_pipeline('main', trigger.token, variables={"DEPLOY_ZONE": "us-west1"})
while pipeline.finished_at is None:
    pipeline.refresh()
    time.sleep(1)
```

You can trigger a pipeline using token authentication instead of user authentication. To do so create an anonymous Gitlab instance and use lazy objects to get the associated project:

```
gl = gitlab.Gitlab(URL)  # no authentication
project = gl.projects.get(project_id, lazy=True)  # no API call
project.trigger_pipeline('main', trigger_token)
```

Reference: <https://docs.gitlab.com/ee/ci/triggers/#trigger-token>

## Pipeline schedule

You can schedule pipeline runs using a cron-like syntax. Variables can be associated with the scheduled pipelines.

## Reference

- v4 API
  - `gitlab.v4.objects.ProjectPipelineSchedule`
  - `gitlab.v4.objects.ProjectPipelineScheduleManager`
  - `gitlab.v4.objects.Project.pipelineschedules`
  - `gitlab.v4.objects.ProjectPipelineScheduleVariable`
  - `gitlab.v4.objects.ProjectPipelineScheduleVariableManager`
  - `gitlab.v4.objects.Project.pipelineschedules`
- GitLab API: [https://docs.gitlab.com/ce/api/pipeline\\_schedules.html](https://docs.gitlab.com/ce/api/pipeline_schedules.html)

## Examples

List pipeline schedules:

```
scheds = project.pipelineschedules.list()
```

Get a single schedule:

```
sched = projects.pipelineschedules.get(schedule_id)
```

Create a new schedule:

```
sched = project.pipelineschedules.create({
    'ref': 'main',
    'description': 'Daily test',
    'cron': '@ 1 * * *'})
```

Update a schedule:

```
sched.cron = '1 2 * * *'
sched.save()
```

Take ownership of a schedule:

```
sched.take_ownership()
```

Trigger a pipeline schedule immediately:

```
sched = projects.pipelineschedules.get(schedule_id)
sched.play()
```

Delete a schedule:

```
sched.delete()
```

List schedule variables:

```
# note: you need to use get() to retrieve the schedule variables. The
# attribute is not present in the response of a list() call
sched = projects.pipelineschedules.get(schedule_id)
vars = sched.attributes['variables']
```

Create a schedule variable:

```
var = sched.variables.create({'key': 'foo', 'value': 'bar'})
```

Edit a schedule variable:

```
var.value = 'new_value'
var.save()
```

Delete a schedule variable:

```
var.delete()
```

## Jobs

Jobs are associated to projects, pipelines and commits. They provide information on the jobs that have been run, and methods to manipulate them.

## Reference

- v4 API
  - `gitlab.v4.objects.ProjectJob`
  - `gitlab.v4.objects.ProjectJobManager`
  - `gitlab.v4.objects.Project.jobs`
- GitLab API: <https://docs.gitlab.com/ce/api/jobs.html>

## Examples

Jobs are usually automatically triggered, but you can explicitly trigger a new job:

```
project.trigger_build('main', trigger_token,
                      {'extra_var1': 'foo', 'extra_var2': 'bar'})
```

List jobs for the project:

```
jobs = project.jobs.list()
```

Get a single job:

```
project.jobs.get(job_id)
```

List the jobs of a pipeline:

```
project = gl.projects.get(project_id)
pipeline = project.pipelines.get(pipeline_id)
jobs = pipeline.jobs.list()
```

**Note:** Job methods (play, cancel, and so on) are not available on ProjectPipelineJob objects. To use these methods create a ProjectJob object:

```
pipeline_job = pipeline.jobs.list()[0]
job = project.jobs.get(pipeline_job.id, lazy=True)
job.retry()
```

Get the artifacts of a job:

```
build_or_job.artifacts()
```

Get the artifacts of a job by its name from the latest successful pipeline of a branch or tag:

```
project.artifacts.download(ref_name='main', job='build')
```

**Attention:** An older method `project.artifacts()` is deprecated and will be removed in a future version.

**Warning:** Artifacts are entirely stored in memory in this example.

You can download artifacts as a stream. Provide a callable to handle the stream:

```
with open("archive.zip", "wb") as f:
    build_or_job.artifacts(streamed=True, action=f.write)
```

You can also directly stream the output into a file, and unzip it afterwards:

```
zipfn = "__artifacts.zip"
with open(zipfn, "wb") as f:
    build_or_job.artifacts(streamed=True, action=f.write)
subprocess.run(["unzip", "-bo", zipfn])
os.unlink(zipfn)
```

Delete all artifacts of a project that can be deleted:

```
project.artifacts.delete()
```

Get a single artifact file:

```
build_or_job.artifact('path/to/file')
```

Get a single artifact file by branch and job:

```
project.artifacts.raw('branch', 'path/to/file', 'job')
```

**Attention:** An older method `project.artifact()` is deprecated and will be removed in a future version.

Mark a job artifact as kept when expiration is set:

```
build_or_job.keep_artifacts()
```

Delete the artifacts of a job:

```
build_or_job.delete_artifacts()
```

Get a job trace:

```
build_or_job.trace()
```

**Warning:** Traces are entirely stored in memory unless you use the streaming feature. See [the artifacts example](#).

Cancel/retry a job:

```
build_or_job.cancel()  
build_or_job.retry()
```

Play (trigger) a job:

```
build_or_job.play()
```

Erase a job (artifacts and trace):

```
build_or_job.erase()
```

```

## 6.4.36 Projects

### Projects

### Reference

- v4 API:
  - `gitlab.v4.objects.Project`
  - `gitlab.v4.objects.ProjectManager`
  - `gitlab.Gitlab.projects`
- GitLab API: <https://docs.gitlab.com/ce/api/projects.html>

## Examples

List projects:

```
projects = gl.projects.list()
```

The API provides several filtering parameters for the listing methods:

- `archived`: if True only archived projects will be returned
- `visibility`: returns only projects with the specified visibility (can be `public`, `internal` or `private`)
- `search`: returns project matching the given pattern

Results can also be sorted using the following parameters:

- `order_by`: sort using the given argument. Valid values are `id`, `name`, `path`, `created_at`, `updated_at` and `last_activity_at`. The default is to sort by `created_at`
- `sort`: sort order (`asc` or `desc`)

```
# List all projects (default 20)
projects = gl.projects.list(all=True)
# Archived projects
projects = gl.projects.list(archived=1)
# Limit to projects with a defined visibility
projects = gl.projects.list.visibility='public')

# List owned projects
projects = gl.projects.list(owned=True)

# List starred projects
projects = gl.projects.list(starred=True)
```

(continues on next page)

(continued from previous page)

```
# Search projects
projects = gl.projects.list(search='keyword')
```

**Note:** To list the starred projects of another user, see the [Users API docs](#).

**Note:** Fetching a list of projects, doesn't include all attributes of all projects. To retrieve all attributes, you'll need to fetch a single project

Get a single project:

```
# Get a project by ID
project_id = 851
project = gl.projects.get(project_id)

# Get a project by name with namespace
project_name_with_namespace = "namespace/project_name"
project = gl.projects.get(project_name_with_namespace)
```

Create a project:

```
project = gl.projects.create({'name': 'project1'})
```

Create a project for a user (admin only):

```
alice = gl.users.list(username='alice')[0]
user_project = alice.projects.create({'name': 'project'})
user_projects = alice.projects.list()
```

Create a project in a group:

```
# You need to get the id of the group, then use the namespace_id attribute
# to create the group
group_id = gl.groups.list(search='my-group')[0].id
project = gl.projects.create({'name': 'myrepo', 'namespace_id': group_id})
```

List a project's groups:

```
# Get a list of ancestor/parent groups for a project.
groups = project.groups.list()
```

Update a project:

```
project.snippets_enabled = 1
project.save()
```

Set the avatar image for a project:

```
# the avatar image can be passed as data (content of the file) or as a file
# object opened in binary mode
```

(continues on next page)

(continued from previous page)

```
project.avatar = open('path/to/file.png', 'rb')
project.save()
```

Delete a project:

```
gl.projects.delete(project_id)
# or
project.delete()
```

# fork to a specific namespace
fork = project.forks.create({'namespace': 'myteam'})
```

Get a list of forks for the project:

```
forks = project.forks.list()
```

project.delete_fork_relation()
```

Get languages used in the project with percentage value:

```
languages = project.languages()
```

```
# list the content of the root directory for the default branch
items = project.repository_tree()

# list the content of a subdirectory on a specific branch
items = project.repository_tree(path='docs', ref='branch1')
```

Get the content and metadata of a file for a commit, using a blob sha:

```
items = project.repository_tree(path='docs', ref='branch1')
file_info = p.repository_blob(items[0]['id'])
content = base64.b64decode(file_info['content'])
size = file_info['size']
```

Update a project submodule:

```
items = project.update_submodule(
    submodule="foo/bar",
    branch="main",
    commit_sha="4c3674f66071e30b3311dac9b9ccc90502a72664",
    commit_message="Message", # optional
)
```

# get the archive for a branch/tag/commit
tzg = project.repository_archive(sha='4567abc')

# get the archive in a different format
zip = project.repository_archive(format='zip')
```

---

**Note:** For the formats available, refer to <https://docs.gitlab.com/ce/api/repositories.html#get-file-archive>

---

**Warning:** Archives are entirely stored in memory unless you use the streaming feature. See [the artifacts example](#).

Get the content of a file using the blob id:

```
# find the id for the blob (simple search)
id = [d['id']] for d in p.repository_tree() if d['name'] == 'README.rst'][0]

# get the content
file_content = p.repository_raw_blob(id)
```

**Warning:** Blobs are entirely stored in memory unless you use the streaming feature. See [the artifacts example](#).

Get a snapshot of the repository:

```
tar_file = project.snapshot()
```

**Warning:** Snapshots are entirely stored in memory unless you use the streaming feature. See [the artifacts example](#).

Compare two branches, tags or commits:

```
result = project.repository_compare('main', 'branch1')

# get the commits
for commit in result['commits']:
    print(commit)

# get the diffs
for file_diff in result['diffs']:
    print(file_diff)
```

Get a list of contributors for the repository:

```
contributors = project.repository_contributors()
```

Get a list of users for the repository:

```
users = p.users.list()

# search for users
users = p.users.list(search='pattern')
```

Start the pull mirroring process (EE edition):

```
project.mirror_pull()
```

## Import / Export

You can export projects from gitlab, and re-import them to create new projects or overwrite existing ones.

## Reference

- v4 API:
  - *gitlab.v4.objects.ProjectExport*
  - *gitlab.v4.objects.ProjectExportManager*
  - *gitlab.v4.objects.Project.exports*

- GitLab API: [https://docs.gitlab.com/ce/api/project\\_import\\_export.html](https://docs.gitlab.com/ce/api/project_import_export.html)

## Examples

A project export is an asynchronous operation. To retrieve the archive generated by GitLab you need to:

1. Create an export using the API
2. Wait for the export to be done
3. Download the result

```
# Create the export
p = gl.projects.get(my_project)
export = p.exports.create()

# Wait for the 'finished' status
export.refresh()
while export.export_status != 'finished':
    time.sleep(1)
    export.refresh()

# Download the result
with open('/tmp/export.tgz', 'wb') as f:
    export.download(streamed=True, action=f.write)
```

Import the project:

```
output = gl.projects.import_project(open('/tmp/export.tgz', 'rb'), 'my_new_project')
# Get a ProjectImport object to track the import status
project_import = gl.projects.get(output['id'], lazy=True).imports.get()
while project_import.import_status != 'finished':
    time.sleep(1)
    project_import.refresh()
```

```
attr = project.customattributes.get(attr_key)
```

Set (create or update) a custom attribute for a project:

```
attr = project.customattributes.set(attr_key, attr_value)
```

Delete a custom attribute for a project:

```
attr.delete()  
# or  
project.customattributes.delete(attr_key)
```

Search projects by custom attribute:

```
project.customattributes.set('type', 'internal')  
gl.projects.list(custom_attributes={'type': 'internal'})
```

  - `gitlab.v4.objects.Project.files`
- GitLab API: [https://docs.gitlab.com/ce/api/repository\\_files.html](https://docs.gitlab.com/ce/api/repository_files.html)

## Examples

Get a file:

```
f = project.files.get(file_path='README.rst', ref='main')  
  
# get the base64 encoded content  
print(f.content)  
  
# get the decoded content  
print(f.decode())
```

Get a raw file:

```
raw_content = project.files.raw(file_path='README.rst', ref='main')
print(raw_content)
with open('/tmp/raw-download.txt', 'wb') as f:
    project.files.raw(file_path='README.rst', ref='main', streamed=True, action=f.write)
```

Create a new file:

```
f = project.files.create({'file_path': 'testfile.txt',
                           'branch': 'main',
                           'content': file_content,
                           'author_email': 'test@example.com',
                           'author_name': 'yourname',
                           'commit_message': 'Create testfile'})
```

Update a file. The entire content must be uploaded, as plain text or as base64 encoded text:

```
f.content = 'new content'
f.save(branch='main', commit_message='Update testfile')

# or for binary data
# Note: decode() is required with python 3 for data serialization. You can omit
# it with python 2
f.content = base64.b64encode(open('image.png').read()).decode()
f.save(branch='main', commit_message='Update testfile', encoding='base64')
```

Delete a file:

```
f.delete(commit_message='Delete testfile', branch='main')
# or
project.files.delete(file_path='testfile.txt', commit_message='Delete testfile', branch=
↪'main')
```

Get file blame:

```
b = project.files.blame(file_path='README.rst', ref='main')
```

```

Update a snippet:

```
snippet.code = 'import gitlab\nimport whatever'
snippet.save
```

Delete a snippet:

```

```

Add a project member:

```
member = project.members.create({'user_id': user.id, 'access_level': gitlab.const.DEVELOPER_ACCESS})
```

Modify a project member (change the access level):

```
member.access_level = gitlab.const.MAINTAINER_ACCESS  
member.save()
```

```

## 6.4.38 Protected branches

You can define a list of protected branch names on a repository. Names can use wildcards (\*).

### References

- v4 API:
  - `gitlab.v4.objects.ProjectProtectedBranch`
  - `gitlab.v4.objects.ProjectProtectedBranchManager`

p_branches = project.protectedbranches.list()
```

Get a single protected branch:

```
p_branch = project.protectedbranches.get('main')
```

```
p_branch = project.protectedbranches.create({  
    'name': '*-stable',  
    'merge_access_level': gitlab.const.DEVELOPER_ACCESS,  
    'push_access_level': gitlab.const.MAINTAINER_ACCESS  
})
```

Create a protected branch with more granular access control:

```
p_branch = project.protectedbranches.create({  
    'name': '*-stable',  
    'allowed_to_push': [{"user_id": 99}, {"user_id": 98}],  
    'allowed_to_merge': [{"group_id": 653}],  
    'allowed_to_unprotect': [{"access_level": gitlab.const.MAINTAINER_ACCESS}]  
})
```

Delete a protected branch:

```
project.protectedbranches.delete('*-stable')  
# or  
p_branch.delete()
```

## 6.4.39 Releases

### Project releases

#### Reference

- v4 API:
  - `gitlab.v4.objects.ProjectRelease`
  - `gitlab.v4.objects.ProjectReleaseManager`
  - `gitlab.v4.objects.Project.releases`
- Gitlab API: <https://docs.gitlab.com/ee/api/releases/index.html>

### Examples

Get a list of releases from a project:

```
project = gl.projects.get(project_id, lazy=True)
release = project.releases.list()
```

Get a single release:

```
release = project.releases.get('v1.2.3')
```

Edit a release:

```
release.name = "Demo Release"
release.description = "release notes go here"
release.save()
```

Create a release for a project tag:

```
release = project.releases.create({'name':'Demo Release', 'tag_name':'v1.2.3',
                                   'description':'release notes go here'})
```

Delete a release:

```
# via its tag name from project attributes
release = project.releases.delete('v1.2.3')

# delete object directly
release.delete()
```

---

**Note:** The Releases API is one of the few working with CI\_JOB\_TOKEN, but the project can't be fetched with the token. Thus use `lazy` for the project as in the above example.

Also be aware that most of the capabilities of the endpoint were not accessible with CI\_JOB\_TOKEN until Gitlab version 14.5.

## Project release links

  - `gitlab.v4.objects.ProjectReleaseLinkManager`

### Examples

Get a list of releases from a project:

```
links = release.links.list()
```

Get a single release link:

```
link = release.links.get(1)
```

Create a release link for a release:

```
link = release.links.create({"url": "https://example.com/asset", "name": "asset"})
```

Delete a release link:

```
# via its ID from release attributes
release.links.delete(1)

# delete object directly
link.delete()
```

## 6.4.40 Runners

Runners are external processes used to run CI jobs. They are deployed by the administrator and registered to the GitLab instance.

Shared runners are available for all projects. Specific runners are enabled for a list of projects.

### Global runners (admin)

### Reference

- v4 API:
  - `gitlab.v4.objects.Runner`
  - `gitlab.v4.objects.RunnerManager`
  - `gitlab.Gitlab.runners`
- GitLab API: <https://docs.gitlab.com/ce/api/runners.html>

## Examples

Use the `list()` and `all()` methods to list runners.

Both methods accept a `scope` parameter to filter the list. Allowed values for this parameter are:

- `active`
- `paused`
- `online`
- `specific` (`all()` only)
- `shared` (`all()` only)

---

**Note:** The returned objects hold minimal information about the runners. Use the `get()` method to retrieve detail about a runner.

---

```
# List owned runners
runners = gl.runners.list()
# With a filter
runners = gl.runners.list(scope='active')
# List all runners, using a filter
runners = gl.runners.all(scope='paused')
```

Get a runner's detail:

```
runner = gl.runners.get(runner_id)
```

Register a new runner:

```
runner = gl.runners.create({'token': secret_token})
```

Update a runner:

```
runner = gl.runners.get(runner_id)
runner.tag_list.append('new_tag')
runner.save()
```

Remove a runner:

```
gl.runners.delete(runner_id)
# or
runner.delete()
```

Remove a runner by its authentication token:

```
gl.runners.delete(token="runner-auth-token")
```

Verify a registered runner token:

```
try:
    gl.runners.verify(runner_token)
    print("Valid token")
```

(continues on next page)

(continued from previous page)

```
except GitlabVerifyError:  
    print("Invalid token")
```

```
jobs = runner.jobs.list()
```

Filter the list using the jobs status:

```
# status can be 'running', 'success', 'failed' or 'canceled'  
active_jobs = runner.jobs.list(status='running')
```

### 6.4.41 Project Remote Mirrors

Remote Mirrors allow you to set up push mirroring for a project.

```
mirrors = project.remote_mirrors.list()
```

Create (and enable) a remote mirror for a project:

```
mirror = project.remote_mirrors.create({'url': 'https://gitlab.com/example.git',  
                                         'enabled': True})

```
repositories = project.repositories.list()
repository = repositories.pop()
tags = repository.tags.list()
```

Get specific tag:

```
repository.tags.get(id=tag_name)
```

Delete tag:

```
repository.tags.delete(id=tag_name)
# or
tag = repository.tags.get(id=tag_name)
tag.delete()
```

Delete tag in bulk:

```
repository.tags.delete_in_bulk(keep_n=1)
# or
repository.tags.delete_in_bulk(older_than="1m")
# or
repository.tags.delete_in_bulk(name_regex="v.+", keep_n=2)
```

---

**Note:** Delete in bulk is asynchronous operation and may take a while. Refer to: [https://docs.gitlab.com/ce/api/container\\_registry.html#delete-repository-tags-in-bulk](https://docs.gitlab.com/ce/api/container_registry.html#delete-repository-tags-in-bulk)

#### 6.4.44 Search API

You can search for resources at the top level, in a project or in a group. Searches are based on a scope (issues, merge requests, and so on) and a search string. The following constants are provided to represent the possible scopes:

- Shared scopes (global, group and project):
  - `gitlab.const.SEARCH_SCOPE_PROJECTS`: projects
  - `gitlab.const.SEARCH_SCOPE_ISSUES`: issues
  - `gitlab.const.SEARCH_SCOPE_MERGE_REQUESTS`: merge\_requests
  - `gitlab.const.SEARCH_SCOPE_MILESTONES`: milestones
  - `gitlab.const.SEARCH_SCOPE_WIKI_BLOBS`: wiki\_blobs
  - `gitlab.const.SEARCH_SCOPE_COMMITS`: commits
  - `gitlab.const.SEARCH_SCOPE_BLOBS`: blobs
  - `gitlab.const.SEARCH_SCOPE_USERS`: users
- specific global scope:
  - `gitlab.const.SEARCH_SCOPE_GLOBAL_SNIPPET_TITLES`: snippet\_titles
- specific project scope:
  - `gitlab.const.SEARCH_SCOPE_PROJECT_NOTES`: notes

## Reference

- v4 API:
  - `gitlab.Gitlab.search`
  - `gitlab.v4.objects.Group.search`
  - `gitlab.v4.objects.Project.search`
- GitLab API: <https://docs.gitlab.com/ce/api/search.html>

## Examples

Search for issues matching a specific string:

```
# global search
gl.search(gitlab.const.SEARCH_SCOPE_ISSUES, 'regression')

# group search
group = gl.groups.get('mygroup')
group.search(gitlab.const.SEARCH_SCOPE_ISSUES, 'regression')

# project search
project = gl.projects.get('myproject')
project.search(gitlab.const.SEARCH_SCOPE_ISSUES, 'regression')
```

The `search()` methods implement the pagination support:

```
# get lists of 10 items, and start at page 2
gl.search(gitlab.const.SEARCH_SCOPE_ISSUES, search_str, page=2, per_page=10)

# get a generator that will automatically make required API calls for
# pagination
for item in gl.search(gitlab.const.SEARCH_SCOPE_ISSUES, search_str, as_list=False):
    do_something(item)
```

The search API doesn't return objects, but dicts. If you need to act on objects, you need to create them explicitly:

```
for item in gl.search(gitlab.const.SEARCH_SCOPE_ISSUES, search_str, as_list=False):
    issue_project = gl.projects.get(item['project_id'], lazy=True)
    issue = issue_project.issues.get(item['iid'])
    issue.state = 'closed'
    issue.save()
```

## 6.4.45 Settings

### Reference

- v4 API:
  - `gitlab.v4.objects.ApplicationSettings`
  - `gitlab.v4.objects.ApplicationSettingsManager`
  - `gitlab.Gitlab.settings`

- GitLab API: <https://docs.gitlab.com/ce/api/settings.html>

## Examples

Get the settings:

```
settings = gl.settings.get()
```

Update the settings:

```
settings.signin_enabled = False
settings.save()
```

## 6.4.46 Snippets

### Reference

- v4 API:
  - `gitlab.v4.objects.Snippet`
  - `gitlab.v4.objects.SnippetManager`
  - `gitlab.Gitlab.snippets`
- GitLab API: <https://docs.gitlab.com/ce/api/snippets.html>

## Examples

List snippets owned by the current user:

```
snippets = gl.snippets.list()
```

List the public snippets:

```
public_snippets = gl.snippets.public()
```

Get a snippet:

```
snippet = gl.snippets.get(snippet_id)
# get the content
content = snippet.content()
```

**Warning:** Blobs are entirely stored in memory unless you use the streaming feature. See [the artifacts example](#).

Create a snippet:

```
snippet = gl.snippets.create({'title': 'snippet1',
                             'file_name': 'snippet1.py',
                             'content': open('snippet1.py').read()})
```

Update the snippet attributes:

```
snippet.visibility_level = gitlab.const.VISIBILITY_PUBLIC  
snippet.save()
```

To update a snippet code you need to create a `ProjectSnippet` object:

```
snippet = gl.snippets.get(snippet_id)  
project = gl.projects.get(snippet.project_id, lazy=True)  
editable_snippet = project.snippets.get(snippet.id)  
editable_snippet.code = new_snippet_content  
editable_snippet.save()
```

Delete a snippet:

```
gl.snippets.delete(snippet_id)  
# or  
snippet.delete()
```

Get user agent detail (admin only):

```
detail = snippet.user_agent_detail()
```

### Examples

List the system hooks:

```
hooks = gl.hooks.list()
```

Create a system hook:

```
gl.hooks.get(hook_id)
```

Test a system hook. The returned object is not usable (it misses the hook ID):

```
hook = gl.hooks.create({'url': 'http://your.target.url'})
```

Delete a system hook:

```
gl.hooks.delete(hook_id)  
# or  
hook.delete()
```

### 6.5.3 Submodules

### 6.5.4 gitlab.base module

**class** `gitlab.base.RESTManager`(`gl: gitlab.client.Gitlab, parent: Optional[gitlab.base.RESTObject] = None`)

Bases: object

Base class for CRUD operations on objects.

Derived class must define `_path` and `_obj_cls`.

`_path`: Base URL path on which requests will be sent (e.g. ‘/projects’) `_obj_cls`: The class of objects that will be created

#### Parameters

- **gl** (`gitlab.client.Gitlab`) –
- **parent** (`Optional[gitlab.base.RESTObject]`) –

**Return type** None

**gitlab:** `gitlab.client.Gitlab`

**property** `parent_attrs: Optional[Dict[str, Any]]`

**property** `path: Optional[str]`

**class** `gitlab.base.RESTObject`(`manager: gitlab.base.RESTManager, attrs: Dict[str, Any], *, created_from_list: bool = False`)

Bases: object

Represents an object built from server data.

It holds the attributes known from the server, and the updated attributes in another. This allows smart updates, if the object allows it.

You can redefine `_id_attr` in child classes to specify which attribute must be used as the unique ID. `None` means that the object can be updated without ID in the url.

Likewise, you can define a `_repr_attr` in subclasses to specify which attribute should be added as a human-readable identifier when called in the object’s `__repr__()` method.

#### Parameters

- **manager** (`gitlab.base.RESTManager`) –

- **attrs** (`Dict[str, Any]`) –
- **created\_from\_list** (`bool`) –

**Return type** `None`

**property attributes:** `Dict[str, Any]`

**property encoded\_id:** `Optional[Union[int, str]]`

Ensure that the ID is url-encoded so that it can be safely used in a URL path

**get\_id()** → `Optional[Union[int, str]]`

Returns the id of the resource.

**Return type** `Optional[Union[int, str]]`

**manager:** `gitlab.base.RESTManager`

**pformat()** → `str`

**Return type** `str`

**pprint()** → `None`

**Return type** `None`

**class gitlab.base.RESTObjectList**(`manager: gitlab.base.RESTManager, obj_cls: Type[gitlab.base.RESTObject], _list: gitlab.client.GitlabList`)

Bases: `object`

Generator object representing a list of RESTObject's.

This generator uses the Gitlab pagination system to fetch new data when required.

Note: you should not instantiate such objects, they are returned by calls to RESTManager.list()

#### Parameters

- **manager** (`RESTManager`) – Manager to attach to the created objects
- **obj\_cls** (`Type[gitlab.base.RESTObject]`) – Type of objects to create from the json data
- **\_list** (`gitlab.client.GitlabList`) – A GitlabList object

**Return type** `None`

**property current\_page:** `int`

The current page number.

**next()** → `gitlab.base.RESTObject`

**Return type** `gitlab.base.RESTObject`

**property next\_page:** `Optional[int]`

The next page number.

If None, the current page is the last.

**property per\_page:** `Optional[int]`

The number of items per page.

```
property prev_page: Optional[int]
    The previous page number.
    If None, the current page is the first.
property total: Optional[int]
    The total number of items.
property total_pages: Optional[int]
    The total number of pages.

class gitlab.base.RequiredOptional(required: Tuple[str, ...] = (), optional: Tuple[str, ...] = ())

        • e (Optional[Exception]) –

    Return type argparse.ArgumentParser

gitlab.cli.main() → None

    Return type None

gitlab.cli.register_custom_action(cls_names: Union[str, Tuple[str, ...]], mandatory: Tuple[str, ...] = (),

## 6.5.10 gitlab.utils module

`class gitlab.utils.EncodedId(value: Union[str, int, gitlab.utils.EncodedId])`

Bases: str

A custom `str` class that will return the URL-encoded value of the string.

- Using it recursively will only url-encode the value once.
- Can accept either `str` or `int` as input value.
- Can be used in an f-string and output the URL-encoded string.

Reference to documentation on why this is necessary.

See:

<https://docs.gitlab.com/ee/api/index.html#namespaced-path-encoding>  
<https://docs.gitlab.com/ee/api/index.html#path-parameters>

**Parameters** `value (Union[str, int, EncodedId])` –

**Return type** `Union[int, EncodedId]`

**Parameters**

- `response (requests.models.Response)` –
- `streamed (bool)` –
- `action (Optional[Callable])` –
- `chunk_size (int)` –

**Return type** `Optional[bytes]`

`gitlab.utils.warn(message: str, *, category: Optional[Type] = None, source: Optional[Any] = None) → None`

This `warnings.warn` wrapper function attempts to show the location causing the warning in the user code that called the library.

It does this by walking up the stack trace to find the first frame located outside the `gitlab/` directory. This is helpful to users as it shows them their code that is causing the warning.

**Parameters**

- `message (str)` –

- **category** (*Optional [Type]*) –
- **source** (*Optional [Any]*) –

**Return type** None

## Breaking

- The gitlab CLI will now accept CLI arguments and environment variables for its global options in addition to configuration file options. This may change behavior for some workflows such as running inside GitLab CI and with certain environment variables configured. ([ca58008](#))
- stop encoding ‘.’ to ‘%2E’. This could potentially be a breaking change for users who have incorrectly configured GitLab servers which don’t handle period ‘.’ characters correctly. ([702e41d](#))
- A config file is no longer needed to run the CLI. python-gitlab will default to https://gitlab.com with no authentication if there is no config file provided. python-gitlab will now also only look for configuration in the provided `PYTHON_GITLAB_CFG` path, instead of merging it with user- and system-wide config files. If the environment variable is defined and the file cannot be opened, python-gitlab will now explicitly fail. ([92a893b](#))
- As of python-gitlab 3.0.0, Python 3.6 is no longer supported. Python 3.7 or higher is required. ([414009d](#))
- As of python-gitlab 3.0.0, the default branch for development has changed from `master` to `main`. ([545f8ed](#))
- remove deprecated branch protect methods in favor of the more complete protected branches API. ([9656a16](#))
- The deprecated `name_regex` attribute has been removed in favor of `name_regex_delete`. (see <https://gitlab.com/gitlab-org/gitlab/-/commit/ce99813cf54>) ([c59fbdb](#))
- rename confusing `to_project_id` argument in `transfer_project` to `project_id` (`--project-id` in CLI). This is used for the source project, not for the target namespace. ([ce4bc0d](#))
- remove deprecated constants defined in `gitlab.v4.objects`, and use only `gitlab.const` module ([3f320af](#))
- remove deprecated tag release API. This was removed in GitLab 14.0 ([2b8a94a](#))
- remove deprecated `project.issuesstatistics` in favor of `project.issues_statistics` ([ca7777e](#))
- remove deprecated `members.all()` method in favor of `members_all.list()` ([4d7b848](#))
- remove deprecated `pipelines()` methods in favor of `pipelines.list()` ([c4f5ec6](#))
- python-gitlab will now default to `gitlab.com` if no URL is given ([8236281](#))
- raise error if there is a 301/302 redirection ([d56a434](#))

## 6.8 Release notes

Prior to version 2.0.0 and GitHub Releases, a summary of changes was maintained in release notes. They are available below for historical purposes. For the list of current releases, including breaking changes, please see the changelog.

### 6.8.1 Changes from 1.8 to 1.9

- ProjectMemberManager.all() and GroupMemberManager.all() now return a list of ProjectMember and GroupMember objects respectively, instead of a list of dicts.

### 6.8.2 Changes from 1.7 to 1.8

- You can now use the `query_parameters` argument in method calls to define arguments to send to the GitLab server. This allows to avoid conflicts between python-gitlab and GitLab server variables, and allows to use the python reserved keywords as GitLab arguments.

The following examples make the same GitLab request with the 2 syntaxes:

```
projects = gl.projects.list(owned=True, starred=True)
projects = gl.projects.list(query_parameters={'owned': True, 'starred': True})
```

The following example only works with the new parameter:

```
activities = gl.user_activities.list(
    query_parameters={'from': '2019-01-01'},
    all=True)
```

- Additionally the `all` parameter is not sent to the GitLab anymore.

### 6.8.3 Changes from 1.5 to 1.6

- When python-gitlab detects HTTP redirections from http to https it will raise a `RedirectionError` instead of a cryptic error.

Make sure to use an `https://` protocol in your GitLab URL parameter if the server requires it.

### 6.8.4 Changes from 1.4 to 1.5

- APIv3 support has been removed. Use the 1.4 release/branch if you need v3 support.
- GitLab EE features are now supported: Geo nodes, issue links, LDAP groups, project/group boards, project mirror pulling, project push rules, EE license configuration, epics.
- The `GetFromListMixin` class has been removed. The `get()` method is not available anymore for the following managers:
  - `UserKeyManager`
  - `DeployKeyManager`
  - `GroupAccessRequestManager`
  - `GroupIssueManager`
  - `GroupProjectManager`
  - `GroupSubgroupManager`
  - `IssueManager`
  - `ProjectCommitStatusManager`
  - `ProjectEnvironmentManager`
  - `ProjectLabelManager`
  - `ProjectPipelineJobManager`
  - `ProjectAccessRequestManager`
  - `TodoManager`
- `ProjectPipelineJob` do not inherit from `ProjectJob` anymore and thus can only be listed.

### 6.8.5 Changes from 1.3 to 1.4

- 1.4 is the last release supporting the v3 API, and the related code will be removed in the 1.5 version.

If you are using a GitLab server version that does not support the v4 API you can:

- upgrade the server (recommended)
- make sure to use version 1.4 of python-gitlab (`pip install python-gitlab==1.4`)

See also the [Switching to GitLab API v4 documentation](#).

- python-gitlab now handles the server rate limiting feature. It will pause for the required time when reaching the limit ([documentation](#))
- The `GetFromListMixin.get()` method is deprecated and will be removed in the next python-gitlab version. The goal of this mixin/method is to provide a way to get an object by looping through a list for GitLab objects that don't support the GET method. The method is [broken](#) and conflicts with the GET method now supported by some GitLab objects.

You can implement your own method with something like:

```
def get_from_list(self, id):
    for obj in self.list(as_list=False):
        if obj.get_id() == id:
            return obj
```

- The GroupMemberManager, NamespaceManager and ProjectBoardManager managers now use the GET API from GitLab instead of the GetFromListMixin.get() method.

## 6.8.6 Changes from 1.2 to 1.3

- gitlab.Gitlab objects can be used as context managers in a `with` block.

## 6.8.7 Changes from 1.1 to 1.2

- python-gitlab now respects the `*_proxy`, REQUESTS\_CA\_BUNDLE and CURL\_CA\_BUNDLE environment variables (#352)
- The following deprecated methods and objects have been removed:
  - `gitlab.v3.object` Key and KeyManager objects: use DeployKey and DeployKeyManager instead
  - `gitlab.v3.objects`.Project `archive_` and `unarchive_` methods
  - `gitlab.Gitlab` `credentials_auth`, `token_auth`, `set_url`, `set_token` and `set_credentials` methods. Once a Gitlab object has been created its URL and authentication information cannot be updated: create a new Gitlab object if you need to use new information
- The `todo()` method raises a `GitlabTodoError` exception on error

## 6.8.8 Changes from 1.0.2 to 1.1

- The `ProjectUser` class doesn't inherit from `User` anymore, and the `GroupProject` class doesn't inherit from `Project` anymore. The Gitlab API doesn't provide the same set of features for these objects, so python-gitlab objects shouldn't try to workaround that.

You can create `User` or `Project` objects from `ProjectUser` and `GroupProject` objects using the `id` attribute:

```
for gr_project in group.projects.list():
    # lazy object creation avoids a Gitlab API request
    project = gl.projects.get(gr_project.id, lazy=True)
    project.default_branch = 'develop'
    project.save()
```

### 6.8.9 Changes from 0.21 to 1.0.0

1.0.0 brings a stable python-gitlab API for the v4 Gitlab API. v3 is still used by default.

v4 is mostly compatible with the v3, but some important changes have been introduced. Make sure to read [Switching to GitLab API v4](#).

The development focus will be v4 from now on. v3 has been deprecated by GitLab and will disappear from python-gitlab at some point.

### 6.8.10 Changes from 0.20 to 0.21

- Initial support for the v4 API (experimental)

The support for v4 is stable enough to be tested, but some features might be broken. Please report issues to <https://github.com/python-gitlab/python-gitlab/issues/>

Be aware that the python-gitlab API for v4 objects might change in the next releases.

**Warning:** Consider defining explicitly which API version you want to use in the configuration files or in your `gitlab.Gitlab` instances. The default will change from v3 to v4 soon.

- Several methods have been deprecated in the `gitlab.Gitlab` class:
  - `credentials_auth()` is deprecated and will be removed. Call `auth()`.
  - `token_auth()` is deprecated and will be removed. Call `auth()`.
  - `set_url()` is deprecated, create a new `Gitlab` instance if you need an updated URL.
  - `set_token()` is deprecated, use the `private_token` argument of the `Gitlab` constructor.
  - `set_credentials()` is deprecated, use the `email` and `password` arguments of the `Gitlab` constructor.
- The service listing method (`ProjectServiceManager.list()`) now returns a python list instead of a JSON string.

### 6.8.11 Changes from 0.19 to 0.20

- The `projects` attribute of `Group` objects is not a list of `Project` objects anymore. It is a `Manager` object giving access to `GroupProject` objects. To get the list of projects use:

```
group.projects.list()
```

Related issue: <https://github.com/python-gitlab/python-gitlab/issues/209>

- The `Key` objects are deprecated in favor of the new `DeployKey` objects. They are exactly the same but the name makes more sense.

## 6.9 FAQ

**I cannot edit the merge request / issue I've just retrieved** It is likely that you used a `MergeRequest`, `GroupMergeRequest`, `Issue` or `GroupIssue` object. These objects cannot be edited. But you can create a new `ProjectMergeRequest` or `ProjectIssue` object to apply changes. For example:

```
issue = gl.issues.list()[0]
project = gl.projects.get(issue.project_id, lazy=True)
editable_issue = project.issues.get(issue.iid, lazy=True)
# you can now edit the object
```

See the [merge requests example](#) and the [issues examples](#).

**I get an `AttributeError` when accessing attributes of an object retrieved via a `list()` call.** Fetching a list of objects, doesn't always include all attributes in the objects. To retrieve an object with all attributes use a `get()` call.

Example with projects:

```
for projects in gl.projects.list():
    # Retrieve project object with all attributes
    project = gl.projects.get(project.id)
```

**How can I clone the repository of a project?** python-gitlab doesn't provide an API to clone a project. You have to use a git library or call the git command.

The git URI is exposed in the `ssh_url_to_repo` attribute of `Project` objects.

Example:

```
import subprocess

project = gl.projects.create(data) # or gl.projects.get(project_id)
print(project.attributes) # displays all the attributes
git_url = project.ssh_url_to_repo
subprocess.call(['git', 'clone', git_url])
```

**I get an `AttributeError` when accessing attributes after `save()` or `refresh()`.** You are most likely trying to access an attribute that was not returned by the server on the second request. Please look at the documentation in [Attributes in updated objects](#) to see how to avoid this.
